

Availability:

Where: Irvine, CA (GMT-7)

Times Available: Available anytime of SS1, otherwise not available from 3-5 PM PT on MWF of SS2

I try to avoid using “the” or prepositions to start off my sentences/paragraphs in general. I feel my main objective in the way I write is to keep ideas concise and interesting to whoever the target audience is. I wouldn’t want to read a run-on sentence myself.

I find myself focusing less on the initial flow of my writing and more so on the ideas themselves. As a result, I end up stringing “blocks” of ideas together to form a piece of writing. Evidently, this can cause a chaotic or even incoherent writing style but oftentimes I’m able to pull through. I never really changed the way I write from high school only continuing in WR50. Regrettably, I don’t feel I found much value from WR50 as I rarely employ creative writing skills for storytelling.

Motor Revolution Counter for the 8051 Microcontroller

EECS 113: Assignment3
Code: motorRevCount.txt

Introduction

This 8051 program simulates a motor revolution counter using the microcontroller itself, a DC motor, and LCD in EdSim51.

Program Design

This program displays an approximation for the revolutions per second (RPS) of an attached DC motor on an LCD using an 8051 microcontroller environment. An event timer measures the number of external events, in this case from the motor sensor, in 5ms which is then converted into the approximate RPS. SW0 can be pressed to start the motor and toggle the direction of the motor. A ‘+’ or ‘-’ on the 2nd line of the LCD indicates the direction of the motor.

Hardships

- Converting from Hexadecimal to Decimal to ASCII: Hexadecimal numbers computed by the program have to be converted to ASCII to be displayed on the LCD continuously.
- Timing: Working with timers in a low-level language is very tedious and difficult due to requiring precise calculations based on the clock frequency of the microcontroller itself.

Figure 1 Example: Assigned Report from EECS 113 of Spring Quarter 2025

I rarely write for the sake of writing. I mainly write for lab reports or any other documentation professors expect from me in my engineering course. This type of writing is more tedious and I tend to forget about any of my core writing strategies for this type of writing. In other words, most of my writing doesn’t

require much extensive research/critical thinking. I hope to explore more of this aspect of writing this summer as it proves useful for various facets of academic life.

Outside of school, I mostly read/write when working on personal programming/embedded hardware projects. I research online about topics I'm not familiar with, read datasheets for new electrical components to experiment with, and spend time in the Linux terminal comprised solely of text. Writing is also essential when applying for internship/job opportunities although many of these processes have been automated through the advent of AI technology. It's also expected of me to communicate effectively in continuing to promote my club these upcoming years.

I see "writing" as one way to see the world or process information. Language governs the knowledge we consume. It's the syntax needed to learn more.

I was initially surprised by the central theme exploring suburban areas. I wasn't expecting this course to be based around something familiar to many of us. I, for one, am from the Anaheim/Yorba Linda area known for its mixed urban-suburban vibe. In a sense, I feel I can therefore tackle the projects we do with more confidence and focus on improving the way I write. As of now, I feel this is a rather broad theme and I hope through reading/researching throughout the summer will reveal subpoints that pique my interest and motivate me to delve deeper into the theme of suburbia.

I expect our greatest asset will be our personal life experiences we have living in suburban areas of Southern California going into this course. However, I feel the aim is to learn how to formally validate our points and be able to write with a biased/unbiased approach depending on the context at hand. It's easier to write what we think is true than to write about what others say is true. I expect debates with classmates will show the gaps in knowledge we have in the topic which will be filled over the course of this summer.
